SOFTWARE TRAINING REPORT · VIVA PRESENTATION

Customer ChurnSense AI System

Using customer history to spot a possible exit before it happens

PRESENTED BY	CLASS / SECTION	ROLL NUMBER	GUIDANCE
Gursimran Kaur	BCA 5A	02490202024	Ms. Nehu Gumber

The problem begins when a business learns too late

Today

A customer cancels or moves away.

The business notices after the relationship has already ended.

→

With an early signal

Customer history points to accounts that may need attention before they leave.

✓

The goal is simple

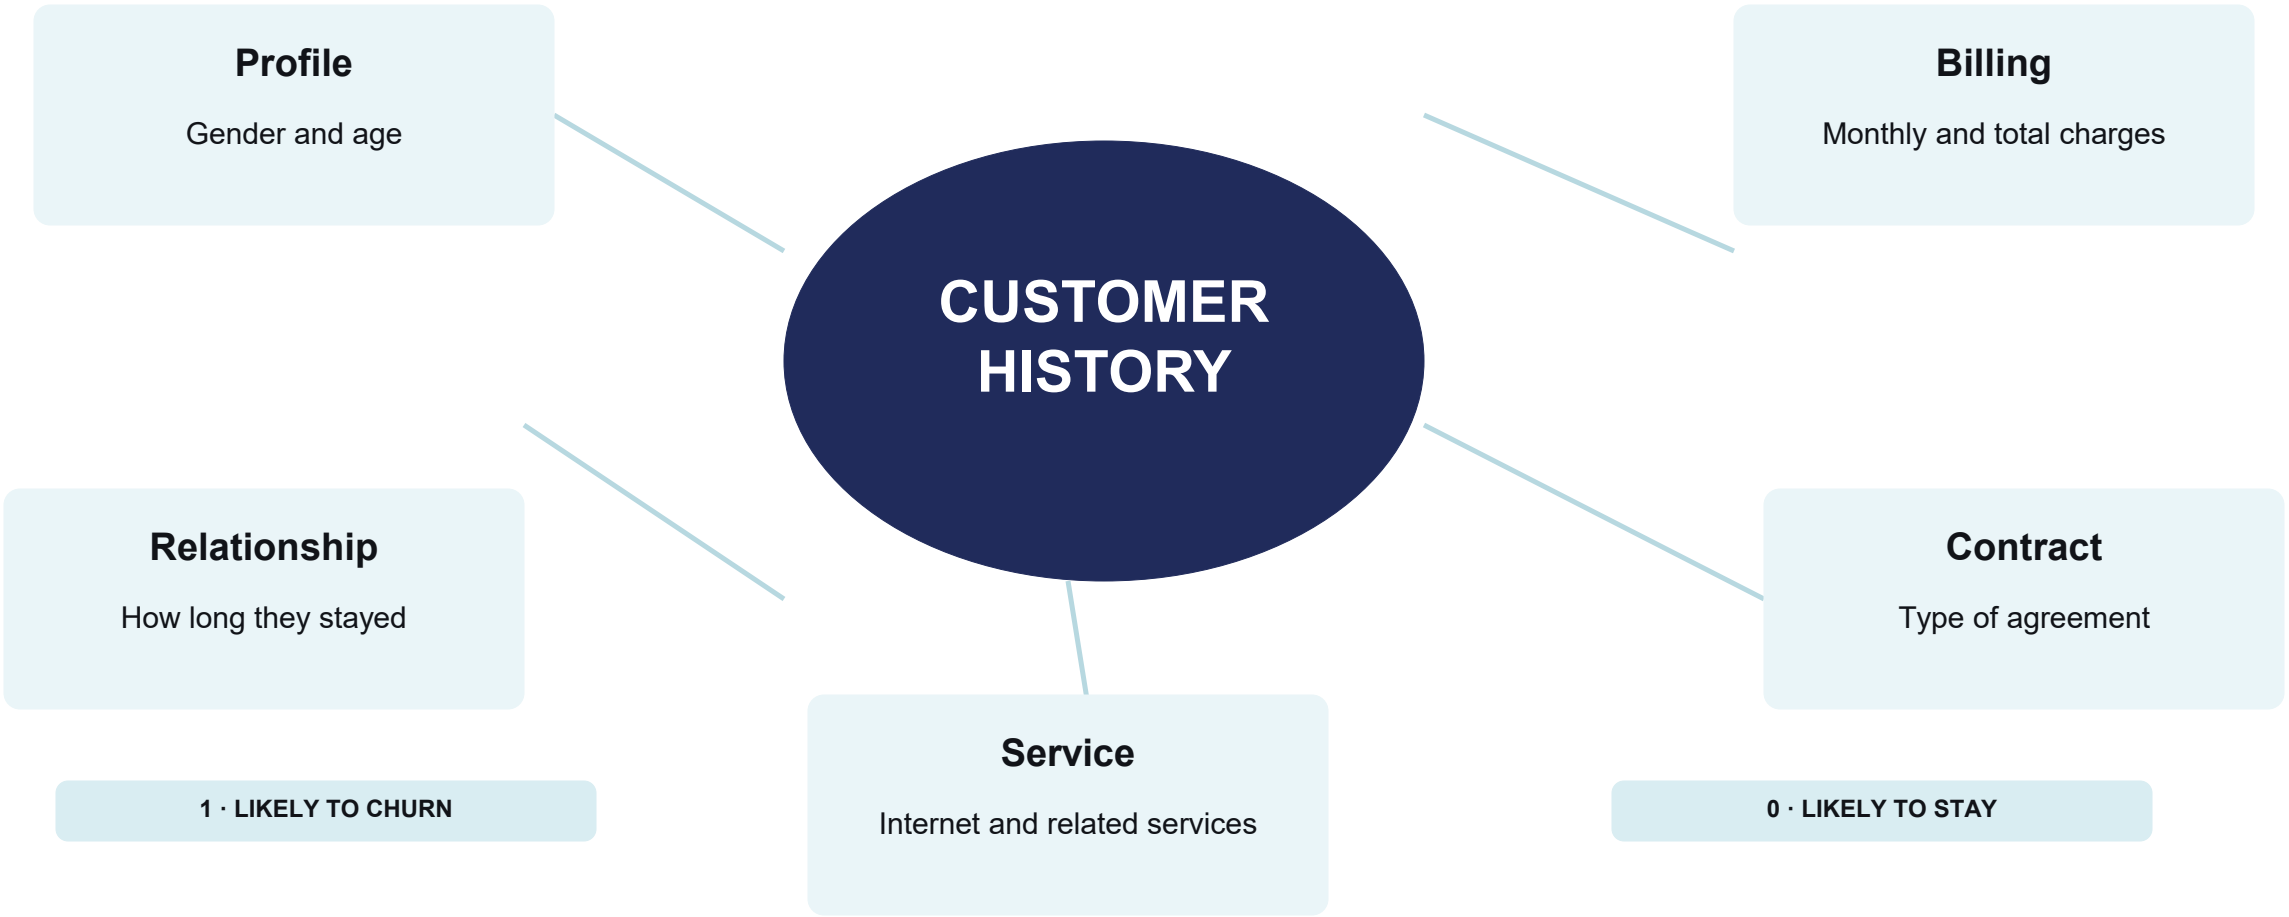

Create time for a thoughtful customer review.

EARLIER SIGNAL

Prediction supports a decision; it does not replace one.

Source: Master synopsis, sections A–C and H

A few customer details form one connected story

Source: Master synopsis, sections A, B and D

The project follows one clear journey from records to a prediction

1

Understand

Look at the customer records

2

Prepare

Clean and organise the information

3

Learn

Train Logistic Regression

4

Check

Test it on unseen records

5

Reuse

Save it for a new customer

80% learns from the data

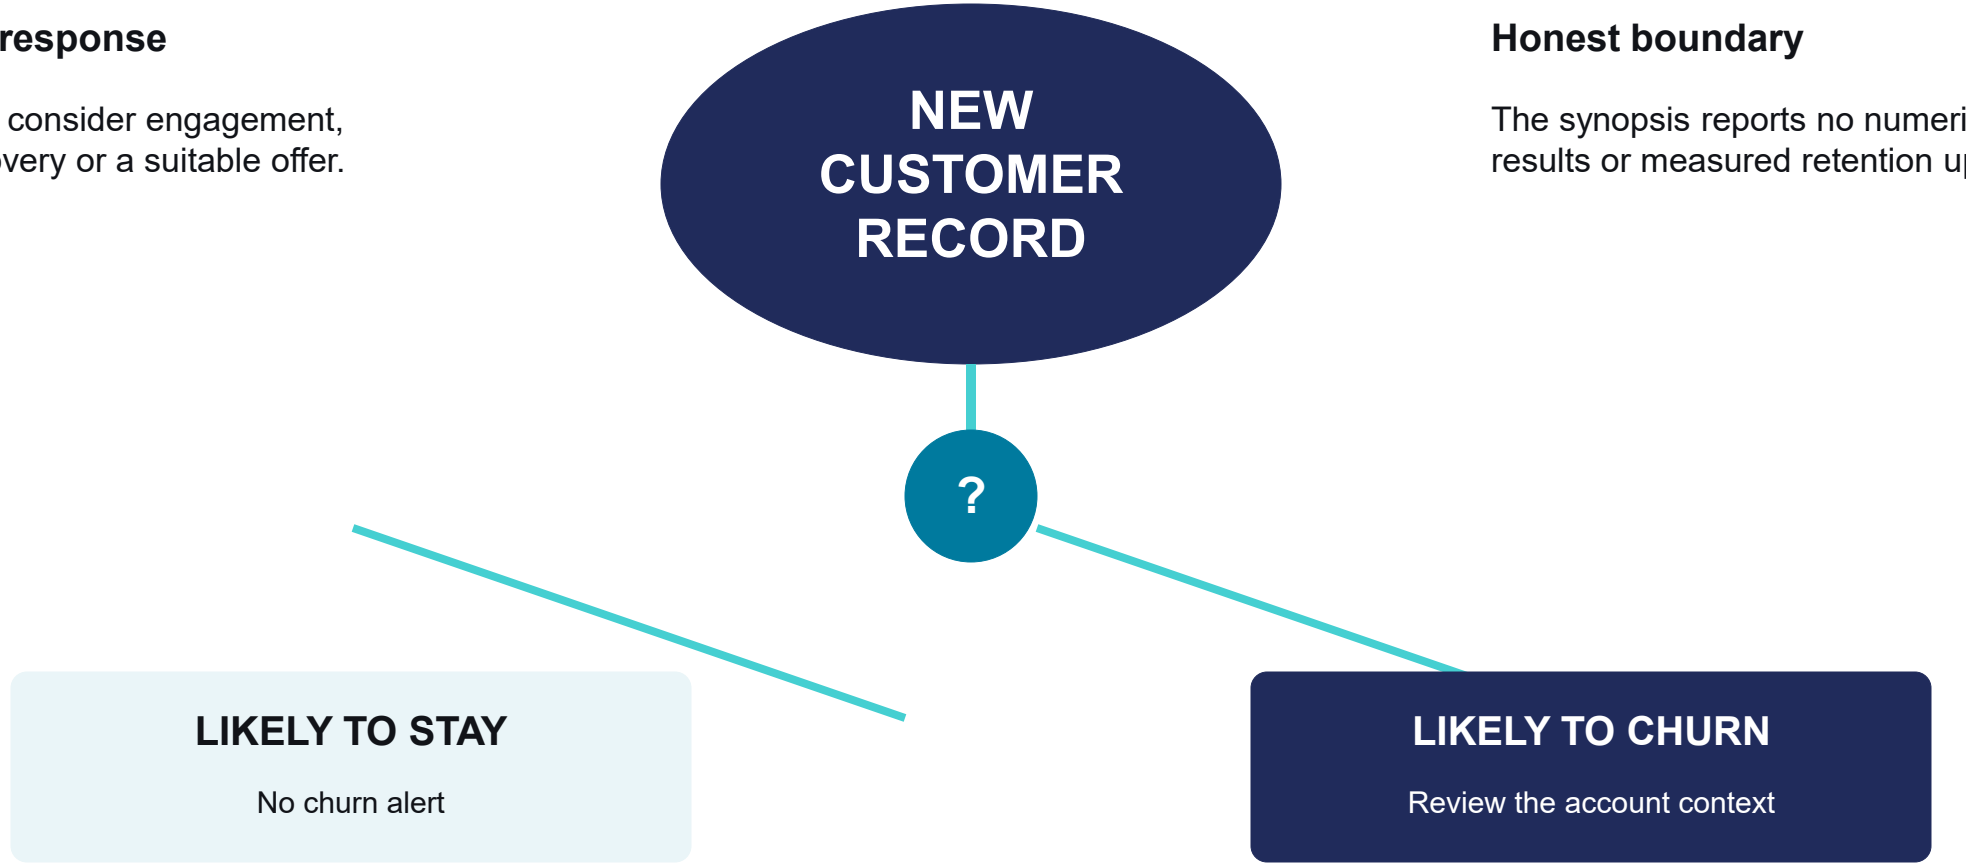

20% checks the result

Source: Master synopsis, sections E–G

The prediction starts a conversation, not an automatic action

Business response

A team may consider engagement, service recovery or a suitable offer.

Honest boundary

The synopsis reports no numerical results or measured retention uplift.

Source: Master synopsis, sections D, G–I

The prototype is complete enough to learn from—and clear about what comes next

WHAT EXISTS TODAY

- ✓ **A small static dataset**
- ✓ One Logistic Regression model
- ✓ Offline testing with an 80:20 split
- ✓ Saved model and scaler

WHERE IT CAN GO

1. Compare more algorithms
2. Improve validation and encoding
3. Add richer customer information
4. **Build a web app and connect live data**

The current dataset has about 1,000 records, so wider testing matters before real business use.
