Enactus DTU: SOCH 6.O

The Social Sports Ideathon

CaseBook

Based on the case provided and any additional research you may wish to conduct, prepare a **5-slide presentation** addressing the following aspects. **The 5 slides exclude the Cover Slide and Appendix/Backup Slides.** Teams are not restricted to the points listed below and may include additional information that strengthens their solution.

1. Problem Analysis

- Clearly define the problem being addressed.
- Identify the key challenges, stakeholders, and underlying causes.
- Establish the scale and significance of the problem using relevant data wherever possible.

2. Proposed Solution / Product Concept

Your proposed solution should cover, where relevant:

a. Core Value Proposition

- What specific problem does the proposed solution address?
- Who does it create value for, and how?

b. Key Features / Solution Components

- How does the solution address the identified problem?
- What makes the proposed approach innovative or differentiated?

c. Go-To-Market (GTM) Strategy

- How will the solution reach its target users/customers?
- What are the key stages of adoption and scaling?

d. Target Customer / Beneficiary Segments

- Who are the primary customers, users, and beneficiaries?
- What are their key needs and pain points?

e. Business Model

- How will the venture generate revenue?
- What are the key cost drivers?
- How will the model achieve long-term financial sustainability?

f. Pricing Strategy

- What will the solution cost?
- How have you arrived at the proposed pricing?

g. Product Positioning & Messaging

- How should the solution be positioned in the market?
- What is the key message that should resonate with the target audience?

h. Promotion & Marketing Channels

- Which channels will be used to acquire customers/users and build awareness?
- Why are these channels appropriate for the target segment?

3. Feasibility & Practicality

Practicality will be a major criterion for evaluation. Teams are expected to demonstrate that their proposed solution can realistically be implemented within the given context.

Consider:

- Operational feasibility
- Financial viability
- Resource requirements
- Stakeholder willingness and partnerships
- Scalability
- Potential implementation challenges and mitigation strategies

4. Basis of Evaluation

The proposed solutions will be evaluated on:

- **Problem Understanding:** Depth of problem analysis and identification of root causes.
- **Clarity of Value Proposition:** Relevance and clarity of the proposed solution.
- **Innovation:** Originality and effectiveness of the proposed approach.
- **GTM & Business Strategy:** Depth and quality of the go-to-market and business model.
- **Practicality & Feasibility:** Real-world implementability, financial viability, and scalability.
- **Social/Environmental Impact:** Potential to create meaningful and measurable impact, where relevant to the case.
- **Overall Coherence:** How effectively the different elements of the solution work together.

5. Research & Evidence

Corroborate your recommendations with **relevant facts, data, market insights, and research** wherever applicable.

- Clearly mention sources and references used.
- Any assumptions made should be explicitly stated and logically justified.
- Teams are encouraged to conduct additional research beyond the information provided in the case.

6. Submission Guidelines

- **Slides:** 5 slides maximum, excluding the Cover Slide and Appendix/Backup Slides.
- **Format:** PDF only.
- **File Naming Convention:** Team Name_Institute Name_Case Number
- Ensure that all information presented is legible and appropriately sourced.
- Appendix slides may be used for supporting calculations, research, frameworks, or additional analysis and will not count toward the 5-slide limit.

Final Presentation Format

Finalists will present their presentations to the judges within **8 minutes**, followed by a **2-minute Q&A session**.

CASE 1: The Idle Ground Economy

Across municipal and district India, vast stretches of land remain unused and economically unproductive. Government-owned vacant plots, panchayat common land, dried riverbeds, and private land awaiting development often generate no value for their owners while gradually deteriorating through soil erosion, informal dumping, and environmental degradation. At the same time, schools, sports clubs, community groups, event organizers, and recreational users frequently struggle to find affordable and accessible spaces for sporting activities and local events.

The growing demand for flexible recreational infrastructure has created an opportunity to rethink how idle land can be utilized. By transforming vacant plots into bookable community sports and event spaces, social enterprises can potentially generate income for landowners while activating underutilized public assets. Beyond revenue generation, such spaces can also serve as catalysts for environmental restoration through initiatives such as native plantation, rainwater percolation systems, soil rehabilitation, and community-led maintenance efforts.

However, building such a model presents several challenges. Landowners and local governing bodies require trust, transparency, and clear incentives to participate. Ground preparation and maintenance must remain affordable while ensuring usability and safety. Additionally, the enterprise must create mechanisms that link commercial usage with measurable ecological improvements and community participation.

Recognizing both the economic and environmental potential of idle land, a group of social entrepreneurs seeks to develop a platform that converts underutilized spaces into productive community assets while generating livelihoods and restoring local ecosystems.

Design a venue-sourcing social enterprise that transforms idle land into income-generating sports and community spaces. Your solution should address stakeholder engagement, landholder incentives, environmental restoration mechanisms, revenue streams, accessibility, trust-building systems, and long-term sustainability. How can entrepreneurship simultaneously create economic value, local livelihoods, and measurable ecological impact through the activation of unused land?

CASE 2: Poshan for Performance -Affordable Nutrition for Grassroots Athletes

Across India, thousands of young athletes train regularly in schools, academies, and community sports programs. However, many athletes from low-income backgrounds struggle to access affordable, protein-rich, and performance-oriented nutrition that supports their athletic development. Commercial sports nutrition products are often priced beyond

their reach, while traditional diets may not consistently provide the nutritional support required for intensive training and competition.

At the same time, women belonging to Self-Help Groups (SHGs) and low-income communities frequently face challenges in securing stable livelihood opportunities despite possessing the skills and local networks required for small-scale food production and distribution.

Growing awareness around health, fitness, and sports performance has created an opportunity to develop locally sourced, affordable nutrition products tailored to grassroots athletes. By leveraging ingredients such as millets, sattu, soy, peanuts, and roasted grains, social enterprises can potentially create accessible nutrition solutions while generating employment opportunities for women entrepreneurs and strengthening local agricultural value chains. The nutritional requirements should be tailored to the specific demands of different sports and developed under appropriate guidance from qualified nutrition and sports-performance professionals to ensure safety, adequacy, and effectiveness.

However, ensuring affordability for athletes while maintaining product quality, distribution efficiency, and financial sustainability remains a significant challenge. The enterprise must balance commercial viability with social impact while building trust among athletes, coaches, institutions, and consumers.

Recognizing the opportunity to address both nutritional inequality and livelihood creation, a group of social entrepreneurs seeks to develop a sustainable sports nutrition ecosystem that benefits athletes, women entrepreneurs, and local producers alike.

Design a social enterprise that provides affordable and performance-oriented nutrition to grassroots athletes while creating sustainable livelihoods for women entrepreneurs. Your solution should address production models, stakeholder partnerships, revenue streams, distribution strategies, affordability mechanisms, and impact measurement. How can entrepreneurship create a self-sustaining ecosystem where improved athletic performance and community livelihoods reinforce one another?

CASE 3: A Kit for a Career- Making Sports Equipment Accessible

For many aspiring athletes, access to quality sports equipment remains one of the biggest barriers to participation and development. The cost of football boots, cricket kits, badminton rackets, protective gear, and other sporting essentials often forces families to compromise on quality or delay purchases altogether. As a result, many athletes train with inadequate equipment or discontinue participation due to financial constraints.

Paradoxically, schools, sports clubs, academies, and households frequently possess large volumes of usable sports equipment that remain idle after upgrades, team changes, or children outgrowing their gear. Significant quantities of equipment therefore remain underutilized while many athletes continue to face affordability challenges.

Increasing awareness around sustainability and circular economy practices has created an opportunity to rethink the lifecycle of sports equipment. By collecting, refurbishing,

repairing, and redistributing pre-owned equipment, social enterprises can potentially reduce waste while making sports more accessible to underserved communities.

However, creating a viable circular ecosystem requires addressing challenges related to collection networks, refurbishment standards, logistics, quality assurance, consumer trust, and long-term financial sustainability. The enterprise must ensure affordability without compromising safety and performance.

Recognizing both the environmental and social impact potential, a group of social entrepreneurs aims to create a circular sports-equipment ecosystem that improves access to quality equipment while reducing waste.

Design a sustainable business model for a circular sports-equipment venture. Your solution should address collection and refurbishment mechanisms, stakeholder engagement, revenue streams, accessibility, scalability, and impact measurement. How can entrepreneurship make quality sports equipment more accessible while simultaneously promoting sustainability and reducing waste?

Case 4: The Computer Vision-to-Talent Bridge: AI-Driven Sportsperson Evaluation

Across India, millions of young sportspersons participate in school competitions, district leagues, and community sports programs every year. While coaches and talent scouts dedicate immense effort to evaluating regional talent, physical presence alone creates natural operational boundaries across vast geographies. Recent advancements in Artificial Intelligence, computer vision, and video-based analytics present a transformative opportunity to complement human scouting by capturing quantitative biomechanical, speed, and positional metrics directly from standard smartphone footage. A social enterprise builds a **Mobile AI Talent Discovery & Showcase Engine** that enables young sportspersons from any region to record standardized drill videos, receive AI-generated performance feedback, and build verified digital profiles for national sports bodies, academies, and sponsors.

The enterprise monetizes through a B2B SaaS model: professional sports academies, talent management firms, and sports federations pay subscription fees for filtered, high-performance talent feeds and data-backed player analytics. Corporate CSR sponsors fund localized "Digital Screening Hubs" equipped with baseline mobile hardware in rural schools, ensuring that internet bandwidth or smartphone access does not become a barrier. The platform incorporates algorithmic calibration models that account for environmental variations (such as uneven playing surfaces or lighting) to ensure standardized, unbiased performance scoring.

The enterprise must manage two core operational friction points: the AI models require strict data privacy, youth consent frameworks, and biometric security standards, while sports scouts demand high analytical accuracy from crowd-sourced, non-professional video inputs.

Design an AI-powered social enterprise model that scales sporting talent discovery through computer vision. How can the enterprise structure its B2B scout subscriptions and CSR partnerships to achieve financial self-sufficiency while maintaining data governance and

algorithmic fairness for under-resourced sportspersons?The proposed solution should provide a clear, step-by-step approach outlining where and how AI and computer vision would be integrated across the talent identification, performance evaluation, verification, and scouting process, while clearly defining the role of human coaches and scouts at each stage.

CASE 5: The Circular Apparel-to-Equipment Engine

India's textile manufacturing sector generates significant volumes of industrial fabric scraps, synthetic offcuts, foam waste, and discarded production materials every year. Much of this material eventually ends up in landfills despite retaining properties that could support alternative manufacturing applications. At the same time, the high cost of sports equipment such as training mats, agility ladders, protective padding, and entry-level training gear continues to limit participation for many athletes and sports programs operating with constrained budgets.

Growing interest in sustainable manufacturing and circular economy practices has created an opportunity to convert industrial textile waste into functional sports equipment. Through localized processing, refurbishment, and manufacturing units, discarded materials could potentially be transformed into affordable, durable, and environmentally responsible athletic products. For instance, in India, end-of-life tyres that cannot be burned are increasingly being upcycled into products such as gym and fitness mats, demonstrating the potential to transform otherwise difficult-to-dispose waste into functional sports infrastructure.

However, building such a venture requires overcoming challenges related to supply-chain consistency, product safety, quality assurance, certification standards, consumer perception, and operational scalability. The enterprise must ensure that affordability does not come at the cost of product performance while simultaneously maintaining financial sustainability.

Recognizing both the environmental and social potential of circular manufacturing, a group of social entrepreneurs aims to create a closed-loop production system that transforms industrial waste into accessible sports equipment for grassroots athletes.

Design a circular-economy social enterprise that converts industrial textile waste into affordable athletic equipment. Your solution should address sourcing mechanisms, manufacturing processes, quality assurance, stakeholder partnerships, revenue streams, and impact measurement. How can entrepreneurship simultaneously reduce industrial waste, expand access to sports equipment, and build a financially sustainable business model?

CASE 6: Solar-Powered Sports Hubs

Across many rural and semi-urban regions, public sports facilities remain underutilized due to inadequate lighting, unreliable electricity supply, and high maintenance costs. As a result, athletes often lose access to safe training environments during evening hours despite growing interest in organized sports participation. Simultaneously, increasing investment in renewable energy infrastructure has created opportunities for decentralized power generation and community-level energy solutions.

A group of social entrepreneurs believes that sports infrastructure can serve a dual purpose by functioning as both community athletic spaces and renewable energy assets. By installing solar-powered canopies and battery storage systems over sports facilities, these spaces could generate clean electricity, improve nighttime usability, and create additional revenue streams through energy sales and commercial bookings.

However, balancing the interests of multiple stakeholders presents significant challenges. Energy infrastructure requires reliable operations, long-term agreements, and regulatory compliance, while communities require affordable and equitable access to sports facilities. The enterprise must also ensure that commercial activities generate sufficient revenue to subsidize community programming without restricting participation.

Recognizing the opportunity to combine renewable energy with social impact, the venture seeks to create a model that improves both energy resilience and sports accessibility.

Design a multi-revenue social enterprise that integrates renewable energy generation with community sports infrastructure. Your solution should address stakeholder partnerships, revenue streams, facility utilization, community access, operational sustainability, and impact measurement. The proposed solution should also account for land and space constraints, ensuring that the placement of solar panels and battery systems maximizes energy generation while minimizing land requirements and without compromising the usability, safety, or accessibility of sports facilities. How can entrepreneurship leverage clean energy to create financially sustainable sports ecosystems while expanding opportunities for underserved youth?

CASE 7: Project AblePlay - Inclusive Sports Through Adaptive Innovation

While global benchmark systems, such as China's state-coordinated disability sport network, achieve international podium dominance holding the top position on the Paralympic medal table since 2004 through dedicated regional training centers and city-wide accessible infrastructure emerging markets encounter critical accessibility bottlenecks. In regions like India, specialized adaptive equipment remains expensive, difficult to import, or locally unavailable, while persons with disabilities frequently face systemic barriers to stable, dignifying employment opportunities.

A social enterprise addresses both challenges simultaneously by establishing a disability-led manufacturing and adaptive sports service hub. Operating micro-workshops staffed and managed by trained mechanics, designers, and technicians with disabilities, the enterprise designs, fabricates, refurbishes, and maintains custom adaptive gear (including lightweight sports wheelchairs, sit-skis, running frames, and customized training attachments) at a fraction of commercial import costs. The venture monetizes by selling B2B "Inclusive Sports & Accessibility" service packages, equipment maintenance contracts, and adaptive coaching toolkits to municipal complexes, educational institutions, and corporate fitness hubs, using commercial profits to cross-subsidize zero-cost adaptive gear distribution and grassroots sports clinics for under-resourced youth with disabilities.

The enterprise faces two distinct operational hurdles: custom adaptive gear must undergo rigorous structural stress-testing to meet international safety and performance standards without exceeding a low-cost baseline, while facility partners require low-disruption, scalable accessibility retrofits and maintenance services that comply with statutory accessibility laws.

Design a disability-led social enterprise strategy that converts localized fabrication and repair into affordable, high-performance adaptive sports equipment while creating sustainable livelihoods for persons with disabilities. The proposed solution should demonstrate how adaptive sports equipment can be designed or modified to improve the efficiency, mobility, comfort, and athletic performance of persons with disabilities, while accounting for their diverse needs. Teams should also present a clear roadmap for integrating emerging technologies—such as 3D printing, advanced materials, sensors, wearable technology, AI, and assistive technologies—to further enhance equipment personalization, performance, safety, and user independence. How can the venture structure its B2B institutional partnerships and cross-subsidized pricing models to achieve financial self-sufficiency while building a scalable pipeline for emerging para-athletes?

CASE 8: The Decentralized Sports Micro-Franchise Engine

Across India, significant investments have been made in developing sports infrastructure through public initiatives, including rural playing fields, community grounds, and district-level sports facilities. However, many of these assets remain underutilized due to inadequate maintenance, inconsistent programming, limited equipment management, and the absence of local ownership. As a result, facilities that were intended to increase sports participation often struggle to deliver sustained community impact and frequently fall into disuse over time.

At the same time, many young people, former athletes, and sports enthusiasts possess the passion and local knowledge required to manage community sports activities but lack access to entrepreneurial opportunities, operational support, and scalable business models. This creates an opportunity to reimagine sports infrastructure not merely as public assets, but as community-driven enterprises capable of generating both social and economic value.

A group of social entrepreneurs proposes a decentralized sports management model built around local micro-franchise operators. Under this approach, trained community members would manage public sports facilities using standardized operating systems, digital booking platforms, equipment management tools, and structured sports programming. These operators could generate revenue through coaching clinics, recreational leagues, equipment rentals, local tournaments, sponsorship partnerships, and community events while receiving ongoing support, technology, and brand infrastructure from a central organization.

However, scaling such a model presents significant challenges. The enterprise must ensure consistent service quality, safety standards, and operational accountability across geographically dispersed locations. At the same time, franchisees must earn sufficient

income to sustain their operations without making participation unaffordable for low-income youth who depend on public sports facilities for access to sport and recreation.

Recognizing the opportunity to combine entrepreneurship, livelihood generation, and community sports development, the venture seeks to build a model that empowers local operators while strengthening grassroots sports ecosystems.

Design a scalable sports micro-franchise social enterprise that enables local entrepreneurs to manage and activate community sports infrastructure. Your solution should address franchise design, operator incentives, revenue streams, technology integration, quality control, affordability mechanisms, stakeholder partnerships, and long-term sustainability. How can entrepreneurship transform underutilized public sports facilities into self-sustaining community assets while ensuring that access to sport remains inclusive and affordable?

CASE 9: Beyond Cricket - Building India's Local & Sustainable Sports Culture

Cricket occupies a dominant position in India's sporting landscape, receiving a significant share of media attention, sponsorship, and public engagement. Meanwhile, numerous local leagues and competitions across sports such as football, basketball, volleyball, kabaddi, athletics, badminton, hockey, and indigenous sports struggle to attract consistent participation, audiences, sponsors, and visibility. Many of these competitions remain largely unknown beyond their immediate communities, limiting opportunities for athletes and slowing the development of local sporting ecosystems.

At the grassroots level, local competitions are often organised by schools, clubs, academies, colleges, and community groups with limited resources and outreach capabilities. As a result, promising athletes may have fewer opportunities to compete, local sporting events struggle to build sustained audiences, and communities remain disconnected from sporting activities taking place around them.

At the same time, sporting events can create significant environmental challenges through single-use plastics, discarded promotional materials, food and beverage packaging, transportation, and temporary event infrastructure. Smaller local competitions often lack the resources or systems to adopt sustainable event practices. This creates an opportunity to rethink not only how local sports are promoted and experienced, but also how their environmental footprint can be reduced.

With a growing young population, increasing digital consumption, and rising interest in sports beyond cricket, there is an opportunity to build stronger local sporting cultures while creating positive environmental and social impact.

A group of social entrepreneurs aims to address these interconnected challenges by developing a sustainable model that increases the visibility and participation of local sporting competitions while generating social, economic, and environmental value for the communities involved.

The venture must navigate challenges including fragmented sporting ecosystems, limited marketing capabilities, audience acquisition, sponsorship, event economics, environmental sustainability, and long-term financial viability.

Design a social enterprise that can strengthen the ecosystem of local sports competitions in India while increasing awareness of sports beyond cricket and promoting environmentally responsible sporting practices. Your solution should address stakeholder engagement, awareness and outreach, revenue generation, environmental sustainability, scalability, and social impact. How can entrepreneurship transform local sporting competitions into sustainable platforms for greater participation, visibility, community opportunity, and environmental responsibility?
